# Starting the Cluster

### Task 1

### Task1: Retail Store Insights

**Scenario**: You're a data analyst at a large retail store. The store sells a variety of products, including books and fruits. The management wants insights into sales patterns, customer preferences, product popularity, and potential promotions.

**Objective**: Analyze the provided dataset to extract meaningful insights and present them to the management.

#### **Instructions**:

#### 1. Initialization:

• Set up your environment by initializing a Spark session. Name this session "RetailStoreInsights".

```
In [1]:
          1
              from pyspark.sql import SparkSession
                                                                                      Python
          2
          3
             spark = SparkSession.builder \
          4
                .remote("sc://192.168.1.7:15002") \
          5
                .appName("RetailStoreInsights") \
          6
                .getOrCreate()
          7
          8
             # limit() shows a nice HTML table in Jupyter, while show() prints plain text
              spark.conf.set('spark.sql.repl.eagerEval.enabled', True)
          10
          11 spark
Out[1]:
          1 <pyspark.sql.connect.session.SparkSession at 0x29256293a10>
                                                                                          out
In [2]:
              from pyspark.sql import Row
                                                                                      Python

         to set this environment variable to '1' in both driver and executor sides
                                                                              (out)
           if you use pyarrow>=2.0.0. pandas-on-Spark will set it for you but it does
           not work if there is a Spark context already launched.
